electrostatic or electrographic printing device arranged above the transport device, the improvement comprising:

a conveying unit (2) integrated with a centering unit (3) of a screen-printing device (SDE) to form a transport device with the electrostatic or electrographic printing device (EDE).

(continued)

2. (Amended) In the device in accordance with claim 1, wherein the electrostatic or electrographic printing device (EDE) is one of vertically lifted off and tilted up from an end, with respect to the conveying unit (2) and the centering unit (3).

3. (Amended) In the device in accordance with claim 2, wherein the electrostatic or electrographic printing device (EDE) is arranged in a support frame (4).

4. (Amended) In the device in accordance with claim 3, wherein the electrostatic or electrographic printing device (EDE) has an endless belt (8) guided over two rollers (9) and the endless belt (8) is tensed, an electrostatic pushbutton with an optical photoconductor roller (10) and a developing unit (11) is arranged above an upper run of the endless belt (8), and on a side of a lower run of the endless belt (8)

A1 (concluded)

facing away from the conveying unit (2) and the centering unit (3) a toner can be transferred by a linearly guided electrostatic doctor blade unit (12) from the endless belt (8) to a workpiece (14) to be printed.

8. (Amended) In the device in accordance with claim 7, wherein the electrostatic doctor blade device (12) comprises a roller which presses the endless belt (8) from the side facing away from the workpiece (14) to be printed on against the workpiece (14).

A2

9. (Amended) In the device in accordance with claim 6, wherein the workpiece (14) to be printed on is placed on a conductive plate (15) and a prestress (16) is applied to the conductive plate (15) and the electrostatic doctor blade device (12) which is changed by a regulating device (17) for adjusting a toner release (19).

10. (Amended) In the device in accordance with claim 9, wherein the workpiece (14) is moved synchronously with a speed of rotation of the roller of a transfer unit (20) and the transfer unit (20) is mounted in the support frame (4).

12. (Amended) In the device in accordance with claim 1, wherein the electrostatic or electrographic printing device (EDE) is arranged in a support frame (4).

Q3

13. (Amended) In the device in accordance with claim 1, wherein the electrostatic or electrographic printing device (EDE) has an endless belt (8) guided over two rollers (9) and the endless belt (8) is tensed, an electrostatic pushbutton with an optical photoconductor roller (10) and a developing unit (11) is arranged above an upper run of the endless belt (8), and on a side of a lower run of the endless belt (8) facing away from the conveying unit (2) and the centering unit (3) a toner can be transferred by a linearly guided electrostatic doctor blade unit (12) from the endless belt (8) to a workpiece (14) to be printed.

Q4

17. (Amended) In the device in accordance with claim 4, wherein the electrostatic doctor blade device (12) comprises a roller which presses the endless belt (8) from the side facing away from the workpiece (14) to be printed on against the workpiece (14).
